

Question 1

$$\begin{bmatrix} 1 & -\lambda & 4 \\ 3 & 2 & -\lambda \end{bmatrix}$$

$$\lambda^2 - 3\lambda + 2 - 12 = \lambda^2 - 3\lambda - 10 = (\lambda + 2)(\lambda - 5)$$

$$\lambda_1 = -2$$

$$\lambda_2 = 5$$

Using λ_1 ,

$$\begin{bmatrix} 1 & -(-2) & 4 \\ 3 & 2 & -(-2) \end{bmatrix}$$

$$\begin{bmatrix} 3 & 4 \\ 3 & 4 \end{bmatrix} \quad 1/3 \cdot R_1 \rightarrow \text{new } R_1$$

$$\begin{bmatrix} 1 & 4/3 \\ 3 & 4 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 4/3 \\ 3 & 4 \end{bmatrix} \quad R_2 - 3 \cdot R_1 \rightarrow \text{new } R_2$$

$$\begin{bmatrix} 1 & 4/3 \\ 0 & 0 \end{bmatrix} \quad 1 \cdot x + 4/3 y = 0 \rightarrow 1 \cdot x = -4/3 y$$

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} -4/3 \\ 1 \end{bmatrix}$$

Using λ_2 ,

$$\begin{bmatrix} 1 & -(5) & 4 \\ 3 & 2 & -(5) \end{bmatrix}$$

$$\begin{bmatrix} -4 & 4 \\ 3 & -3 \end{bmatrix} \quad -1/4 \cdot R_1 \rightarrow \text{new } R_1$$

$$\begin{bmatrix} 1 & -1 \\ 3 & -3 \end{bmatrix}$$

$$\begin{bmatrix} 1 & -1 \\ 3 & -3 \end{bmatrix} \quad R_2 - 3 \cdot R_1 \rightarrow \text{new } R_2$$

$$\begin{bmatrix} 1 & -1 \\ 0 & 0 \end{bmatrix} \quad 1 \cdot x - 1 \cdot y = 0 \rightarrow 1 \cdot x = 1 \cdot y$$

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

d

To reduce the effect of the noise on the computed derivative of the tot signal would be to use a low-pass filter on the signal before differentiation.
